functions,  $h_1$  and  $h_2$ , we always have

The definition can be used to derive a most important property of independent random variables. Given two

 $E\{h_1(y_1)h_2(y_2)\} = E\{h_1(y_1)\}E\{h_2(y_2)\}.$ 

This can be proven as follows:

$$E\{h_1(y_1)h_2(y_2)\} = \int \int h_1(y_1)h_2(y_2)p(y_1,y_2)dy_1dy_2$$

 $= \int \int h_1(y_1)p_1(y_1)h_2(y_2)p_2(y_2)dy_1dy_2 = \int h_1(y_1)p_1(y_1)dy_1 \int h_2(y_2)p_2(y_2)dy_2$ 

$$h_2(y_2) n_2(y_2) dy_2$$

$$d(v_2)dv_2$$

$$y_2(y_2)dy_2$$

(11)

$$dy_2 = \int h_1(y_1)p_1(y_1)dy_1 \int h_2(y_2)p_2(y_1)dy_1$$

$$\int n_1(y_1)p_1(y_1)ay_1 \int n_2(y_2)p_2(y_2)ay_2$$
=  $E(h_1(y_1))E(h_2(y_2))$ 

$$= E\{h_1(y_1)\}E\{h_2(y_2)\}.$$
 (12)
